MitiMaiti - Collaborator Development Guide

Project Overview

MitiMaiti is a Sindhi community matrimony & dating web app built with:

- **Frontend**: Next.js 14 + Tailwind CSS (hosted on Vercel)
- **Backend**: Node.js + Express + TypeScript (hosted on Render)
- **Database**: Supabase (PostgreSQL) in Mumbai region
- **Repo**: https://github.com/techygarry/mitimaiti

Live URLs

Service	URL
Frontend	https://web-one-henna-44.vercel.app
Backend API	https://mitimaiti-backend.onrender.com
GitHub	https://github.com/techygarry/mitimaiti

PART 1: Setup for New Collaborator (Claude Code CLI)

Step 1: Install Prerequisites

```
# Install Node.js 20+ (if not installed)
brew install node

# Install Claude Code CLI
npm install -g @anthropic-ai/claude-code

# Verify installations
node --version    # Should be 20+
claude --version
```

Step 2: Clone the Repository

```
cd ~/Documents
git clone https://github.com/techygarry/mitimaiti.git
cd mitimaiti
```

Step 3: Install Dependencies

```
# Install frontend dependencies
cd web && npm install && cd ..

# Install backend dependencies
cd backend && npm install && cd ..
```

Step 4: Set Up Environment Variables

```
# Frontend (.env.local in web/)
cp .env.example web/.env.local
```

Edit `web/.env.local`:

```
NEXT_PUBLIC_SUPABASE_URL=https://hkrqyxybxorofaafneao.supabase.co
NEXT_PUBLIC_SUPABASE_ANON_KEY=<ask project owner for key>
NEXT_PUBLIC_API_URL=http://localhost:4000
```

Edit `backend/.env`:

```
SUPABASE_URL=https://hkrqyxybxorofaafneao.supabase.co
SUPABASE_SERVICE_ROLE_KEY=<ask project owner for key>
REDIS_URL=<optional, can skip for local dev>
PORT=4000
NODE_ENV=development
FRONTEND_URL=http://localhost:3000
CORS_ORIGINS=http://localhost:3000
```

Step 5: Run Locally

```
# Terminal 1: Start backend
cd backend && npm run dev

# Terminal 2: Start frontend
cd web && npm run dev
```

- Frontend: http://localhost:3000
- Backend: http://localhost:4000

PART 2: Making Changes with Claude Code CLI

Starting Claude Code

```
# Navigate to the project
cd ~/Documents/mitimaiti

# Start Claude Code
claude
```

Example Prompts for Common Tasks

Changing UI / Design

```
Change the welcome page hero gradient from rose to blue
```

```
Make the discovery cards wider and add a shadow effect
```

```
Update the navbar logo text to say "MitiMaiti Beta"
```

Adding Features

```
Add a "Favorites" tab to the inbox page between Liked You and Matches
```

```
Add dark mode support to the entire app
```

```
Create a new /about page with information about MitiMaiti
```

Fixing Bugs

```
The OTP input is not auto-advancing to the next field, fix it
```

```
The profile completeness ring is showing wrong percentage, fix the SVG calculation
```

Backend Changes

```
Add a new endpoint GET /v1/stats that returns total user count
```

```
Update the cultural scoring to weigh language at 25 points instead of 20
```

Database Changes

```
Add a "hobbies" TEXT[] column to the user_basics table
```

Workflow: Edit → Test → Push → Auto-Deploy

```
# 1. Open Claude Code
claude

# 2. Ask Claude to make changes
> Update the premium page pricing to show USD instead of INR

# 3. Claude edits the files. Test locally:
> Run the dev server and check if it works

# 4. Exit Claude Code (Ctrl+C or type /exit)

# 5. Push changes
git add -A
git commit -m "Update premium pricing to USD"
git push

# 6. Auto-deploy happens:
```

```
#    - Vercel rebuilds frontend (~30 seconds)
#    - Render rebuilds backend (~2-3 minutes)
```

Useful Claude Code Commands

Command	What it does
`/help`	Show all available commands
`/clear`	Clear conversation context
`/cost`	Show token usage
`Ctrl+C`	Cancel current operation
`/exit` or `Ctrl+D`	Exit Claude Code

Tips for Effective Claude Code Usage

1. **Be specific**: "Change the button color on the welcome page to blue" is better than "make it look different"
2. **Reference files**: "Update web/src/app/discover/page.tsx to add a filter button" helps Claude find the right file
3. **One change at a time**: Make one change, test, commit. Don't batch 10 changes.
4. **Ask Claude to test**: "Run npm run build to check for errors" before pushing
5. **Read before edit**: Ask Claude to "show me the current discover page code" before making changes

---

Key Theme Colors (Tailwind)

Name	Hex	Usage
rose	#B5336A	Primary buttons, accents
roseDark	#8A1A4A	Hover states
roseLight	#E8A0BE	Backgrounds
gold	#D4A853	Premium, special
charcoal	#2D2426	Headings
textMain	#3D2B33	Body text
textLight	#7A6670	Secondary text
cream	#FFF8F0	Page backgrounds

PART 4: Using Claude Mobile App for Quick Edits

You can use the **Claude mobile app** (iOS/Android) to plan and generate code snippets, then paste them into the project.

How to Use Claude Mobile for Code Changes

1. Ask Claude to generate a component

Open Claude app and type:

```
I'm working on MitiMaiti, a Next.js 14 matrimony app with Tailwind CSS.
The color theme uses: rose (#B5336A), gold (#D4A853), charcoal (#2D2426), cream
(#FFF8F0).

Generate a new "Testimonials" section component for my landing page.
It should show 3 testimonial cards with photo, name, quote, and city.
Use 'use client' directive, framer-motion animations, and Tailwind classes.
Export as default function TestimonialsSection.
```

2. Copy the generated code

Claude will generate the full component. Copy it.

3. Add to project

Option A - Via GitHub web editor:

1. Go to https://github.com/techygarry/mitimaiti
2. Navigate to the file you want to edit
3. Click the pencil icon (Edit)
4. Paste the code
5. Commit directly → Auto-deploys

Option B - Via Claude Code CLI later:

1. Open Claude Code on your computer
2. Say: "Create a new file web/src/components/TestimonialsSection.tsx with this code: [paste]"

4. Useful Mobile Prompts

Generate a new page:

```
Generate a Next.js 14 page for /about that shows the MitiMaiti team.
Use Tailwind CSS with these colors: rose #B5336A, charcoal #2D2426, cream #FFF8F0.
Import AppShell from @/components/ui/AppShell and wrap the content in it.
Make it responsive and modern.
```

Fix a bug (describe and get solution):

```
In my Next.js app, the OTP page has 6 input fields for digits.
Currently when I type a digit it doesn't auto-focus the next input.
Here's my current code: [paste code]
Fix the auto-advance logic.
```

Design review:

```
Here's my current discover page code: [paste code]
Suggest 5 UI improvements to make it look more like Hinge/Bumble.
Give me the updated code for each change.
```

Plan a feature:

```
I want to add a "Stories" feature to MitiMaiti (like Instagram stories
but for sharing cultural moments). What files would I need to create
in my Next.js 14 app? Give me the implementation plan.
```

PART 5: Quick Reference Commands

Daily Development

```
cd ~/Documents/mitimaiti
git pull                          # Get latest changes
```

```
cd web && npm run dev             # Start frontend
# In another terminal:
cd backend && npm run dev         # Start backend
claude                            # Start Claude Code for AI-assisted editing
```

Deploying Changes

```
git add -A
git commit -m "your change description"
git push
# Auto-deploys to Vercel + Render
```

Checking Deployment Status

```
# Frontend (Vercel)
vercel ls

# Backend (Render)
# Check: https://dashboard.render.com
```

Running Build Check Before Pushing

```
cd web && npx next build          # Check for TypeScript/build errors
cd ../backend && npx tsc --noEmit # Check backend TypeScript
```
